Overview

These course notes are excerpted from my textbook “Mathematical Foundations of Computer Networking” published by Addison-Wesley in 2012. I have enhanced them by adding links to YouTube videos.

To use these notes, I suggest the following process:

1. Read the text, which will give you an intuitive overview of each concept, followed by mathematical details.

2. Attend the lecture, ideally after looking through the notes, so you know what material you find more challenging.

3. If you feel that you need more help understanding a concept, click on the video link for a more in-depth explanation. Each video is annotated with its duration.

3. Every concept is illustrated with an example. Read the example problem and attempt to answer it yourself. Then read the answer and compare your answer to the one in the text. This will help you identifying where your grasp of the concept may be shaky.

4. There is an additional folder with example questions. I will hand out answers from time to time during term.
